

ABSTRACT OF THE DISCLOSURE

A lid-member holder is used to define envelopers
5 encapsulating electronic components in production of
hollow-package type electronic products. A plurality of lid
members are temporarily held by the holder body. The lid
members are arranged so as to be consistent with an arrangement
of surrounding wall members, which are to be sealed with the
10 lid members in a lump to define the envelopers, and the
temporary holding of the lid members by the holder body is
realized such that lid members can be separated from the lid
members after the surrounding wall members are completely
sealed with the lid members, without the lid members being
15 removed from the surrounding wall members.
